

CGL-LF: $t \in [6, 18]$; 6 time blocks

$\delta p = p - \langle p \rangle_V$, $\sigma_{\perp,B}^2 = \langle (\delta p_{\perp,B})^2 \rangle_V$, $p_B = |\mathbf{B}|^2/2$. Spectra are time averages; $C_{\perp B}$ and R are spatial statistics at each time. Power-law amplitude is arbitrary; the guide is illustrative, not fitted. Spectral shading shows block ranges.
