

CGL-LF: $t \in [6, 18]$; 6 time blocks

$$c_s^2 = \gamma \langle p_{iso} \rangle_V / \langle \rho \rangle_V, \gamma = 5/3$$

$$p_{iso} = (p_{\parallel} + 2p_{\perp})/3$$

$$u_{rms}^2 = \langle |\mathbf{u} - \langle \mathbf{u} \rangle_V|^2 \rangle_V$$

$$\int E_K dk_{\perp} = \langle \rho |\mathbf{u} - \mathbf{u}_p|^2 / 2 \rangle_V, \mathbf{u}_p = \langle \rho \mathbf{u} \rangle_V / \langle \rho \rangle_V; \int E_B dk_{\perp} = \langle |\mathbf{B} - \langle \mathbf{B} \rangle_V|^2 / 2 \rangle_V.$$

Power-law amplitude is arbitrary; the guide is illustrative, not fitted. Shading shows spectral block ranges or the averaging interval.
The forcing fraction measures acceleration power, not an energy-injection partition.
